Subject: GW Sampling at SWMU 1 - Oceana Tech Memo

Bob:

Here are my comments"

1. I recommend the EPA's approval of Oceana's proposal to conduct four sediment/surface water sampling along the reach of the drainage ditch.

2. Note that in the previous sampling event (1994), no BTEX or PAH with concentration exceeding MCL were detected in the groundwater. This current run of groundwater sampling appears to tell the same story. However, it is a known fact that "free phase liquid" is still present within the estimated limit as shown in Figure 2-1. Oceana may argue that, for all these years, the contaminants were held up by the soil. But, EPA needs to know what's in the free phase liquid? and how much is there?
